

Sylva Introduction

Agenda

- Sylva context
- Sylva Ecosystem
- Sylva Architecture
- Sylva adoption opportunities
- Sylva Stream including validation Center

Time For Action

Historical Model doesn't fit
with multivendor approach
#Shift to a common
Cloud Layer

Operators are increasingly
threatened by hackers
#GSMA 2022 Security Report

New Network Functions
require Cloud native infra
and distributed Cloud
#O-RAN #5GCore #CDN

Continuous Innovation &
Service Automation
#Shortest TTM
(legacy model SW&HW
common releasing)
#Security Response

Mission Statement

The main carriers in Europe, together with network function providers, initiated the Sylva project to address Telco and Edge use cases.

The project objectives are:

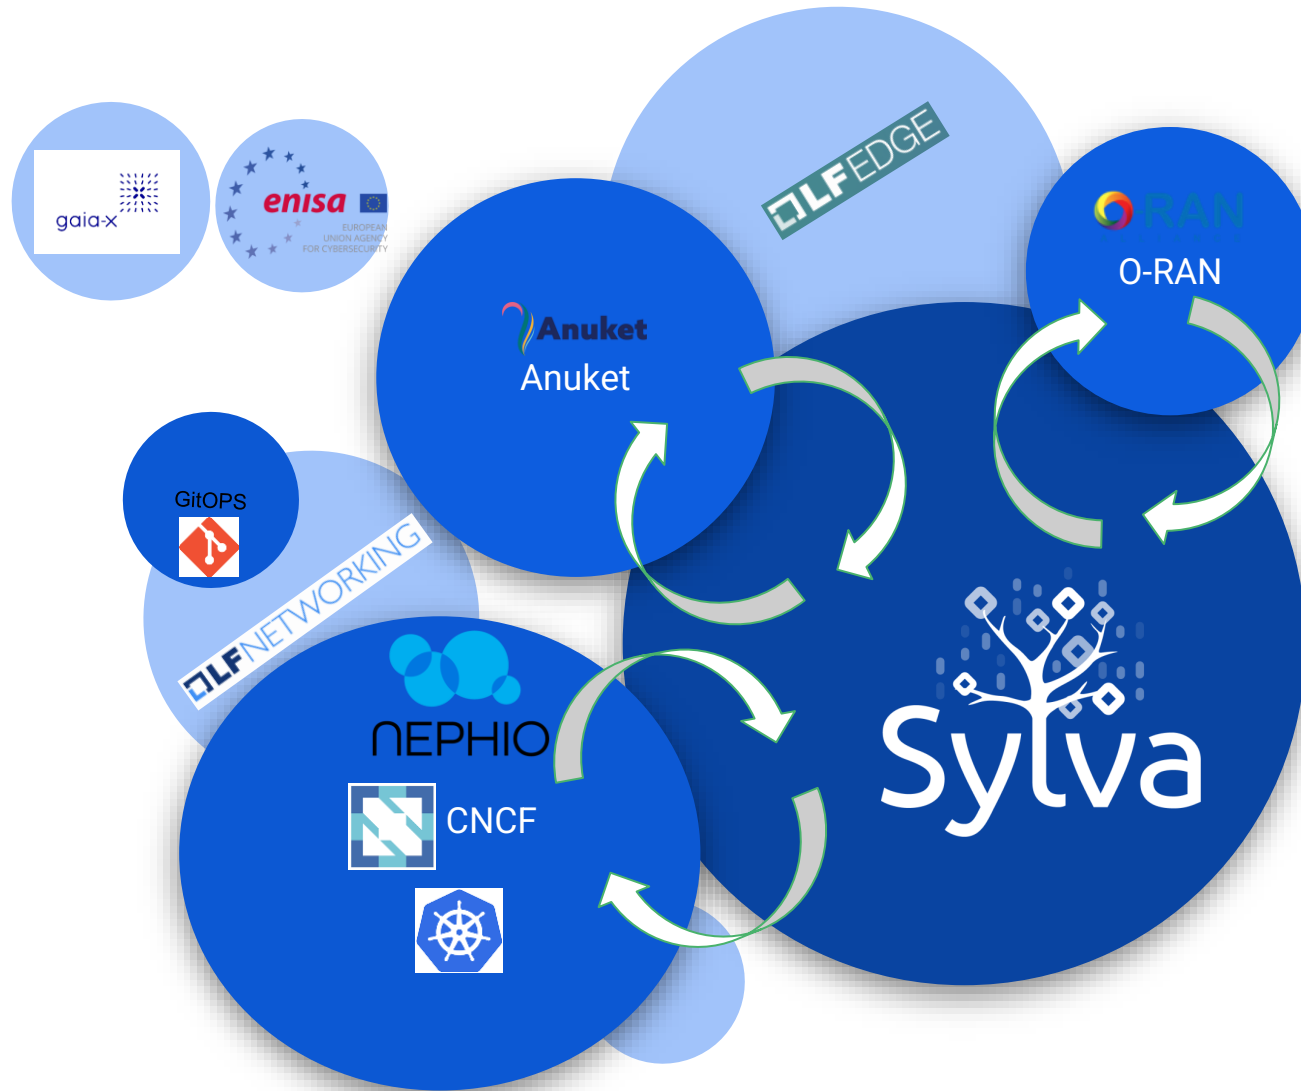

- › To release a cloud software framework tailored for telco and edge requirements that addresses the technical challenges of the infrastructure layer of this ecosystem
- › To develop a reference implementation of the cloud software framework and create a validation program for such implementations

THE **LINUX** FOUNDATION

The Open source ecosystem

Project Synergies

- Anuket (RA2/RC2) covers the specifying, integrating and verifying Telco-specific stacks and the validation of Telco applications
 - Sylva will **leverage** RA2 and cover requirements specific to European Telcos
 - Sylva will **contribute** back specific extensions to Anuket
- CNCF provides necessary components such as OSS projects (K8S) and validation programs (CNF)
 - **Leverage** K8S as part of the software framework
 - **Contribute** extensions that address Telco needs
 - **Build** on top of CNF Validation program
- The O-RAN Software community develops many of the workloads that will use the telco CaaS
 - **Address** requirements of O-RAN workloads (e.g. synchronization cards)
 - Provide **feedback** to the O-RAN-SC and O-RAN workgroups
- Sylva is **based** on open source components such as GitOps, Service Mesh and will **integrate** with the software coming from the LF Networking and Edge umbrella projects
- Sylva will align with the specifications and recommendations of organizations like Gaia-X (Secure and sovereign data management), MITRE and ENISA (Security). It will provide feedback, as necessary, to these organization for further improvements of the specifications.

The 5 technical pillars

Network Performance to answer to CNF requirements and performance

Telco features : SRIOV, DPDK, Low latency, Specific CNI
CaaS on BareMetal

Distributed cloud

BM Automation : Declarative approach & Gitops to manage thousands of heterogenous nodes
MultiK8S : Optimized lifecycle Management of many K8S Clusters in DC

Best in Class Security Design

Answer Telco grade requirements

Energy efficiency

Measure & Optimize to limit Energy Consumption

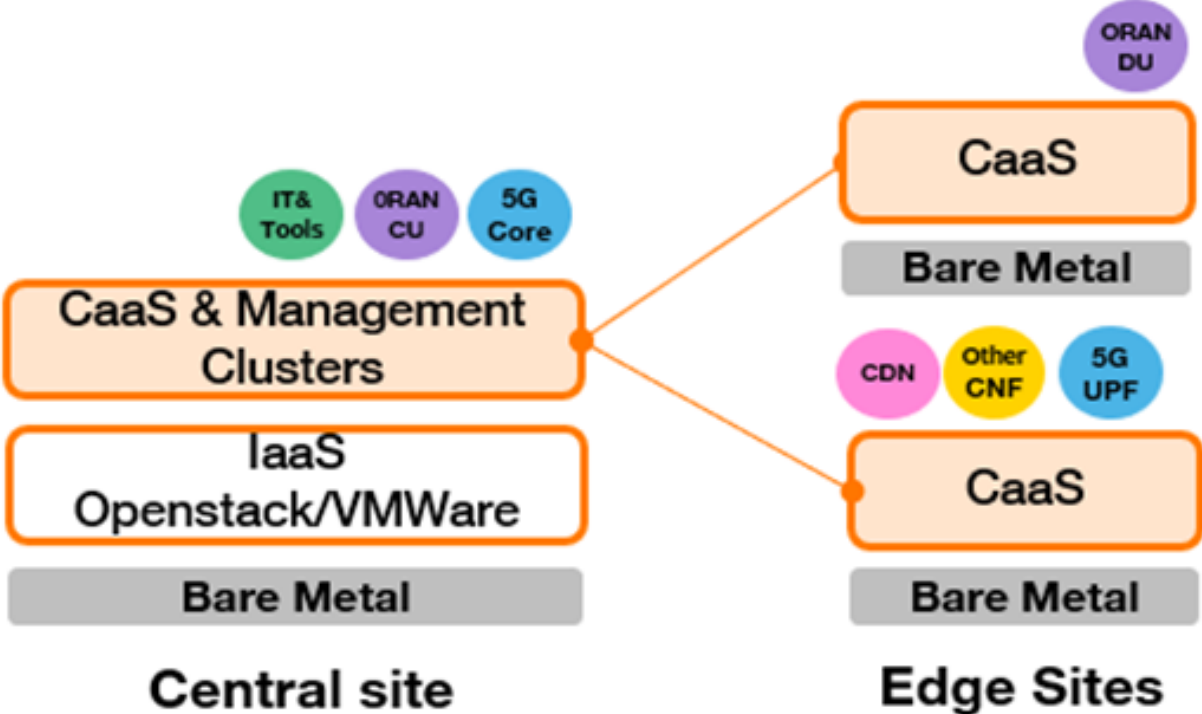

Open source and standardized API

Support multi-Vendor CNF & boost market adoption

Sylva Architecture

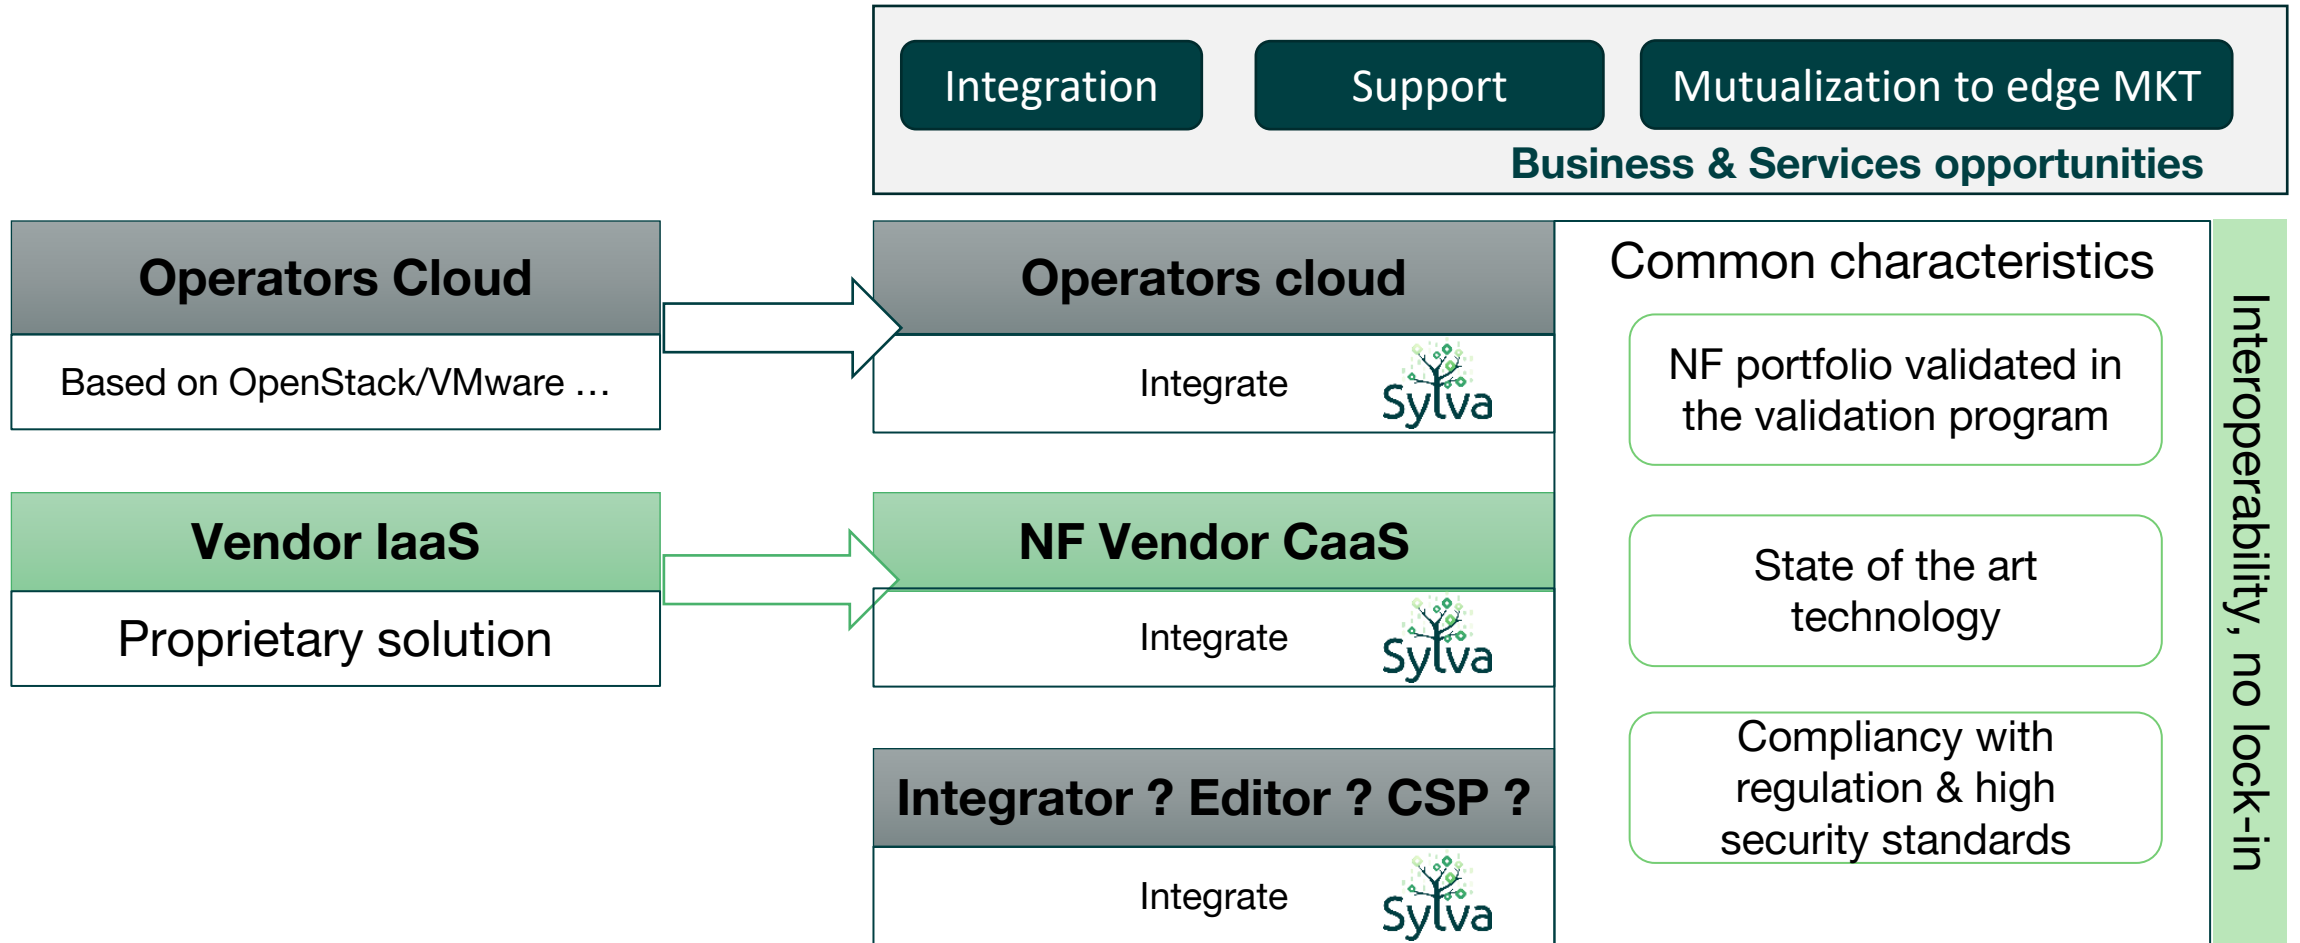

To address such use case as 5GCore Distributed UPF, CDN or Open RAN, Sylva will provide an architecture able to manage from Central to far edge site

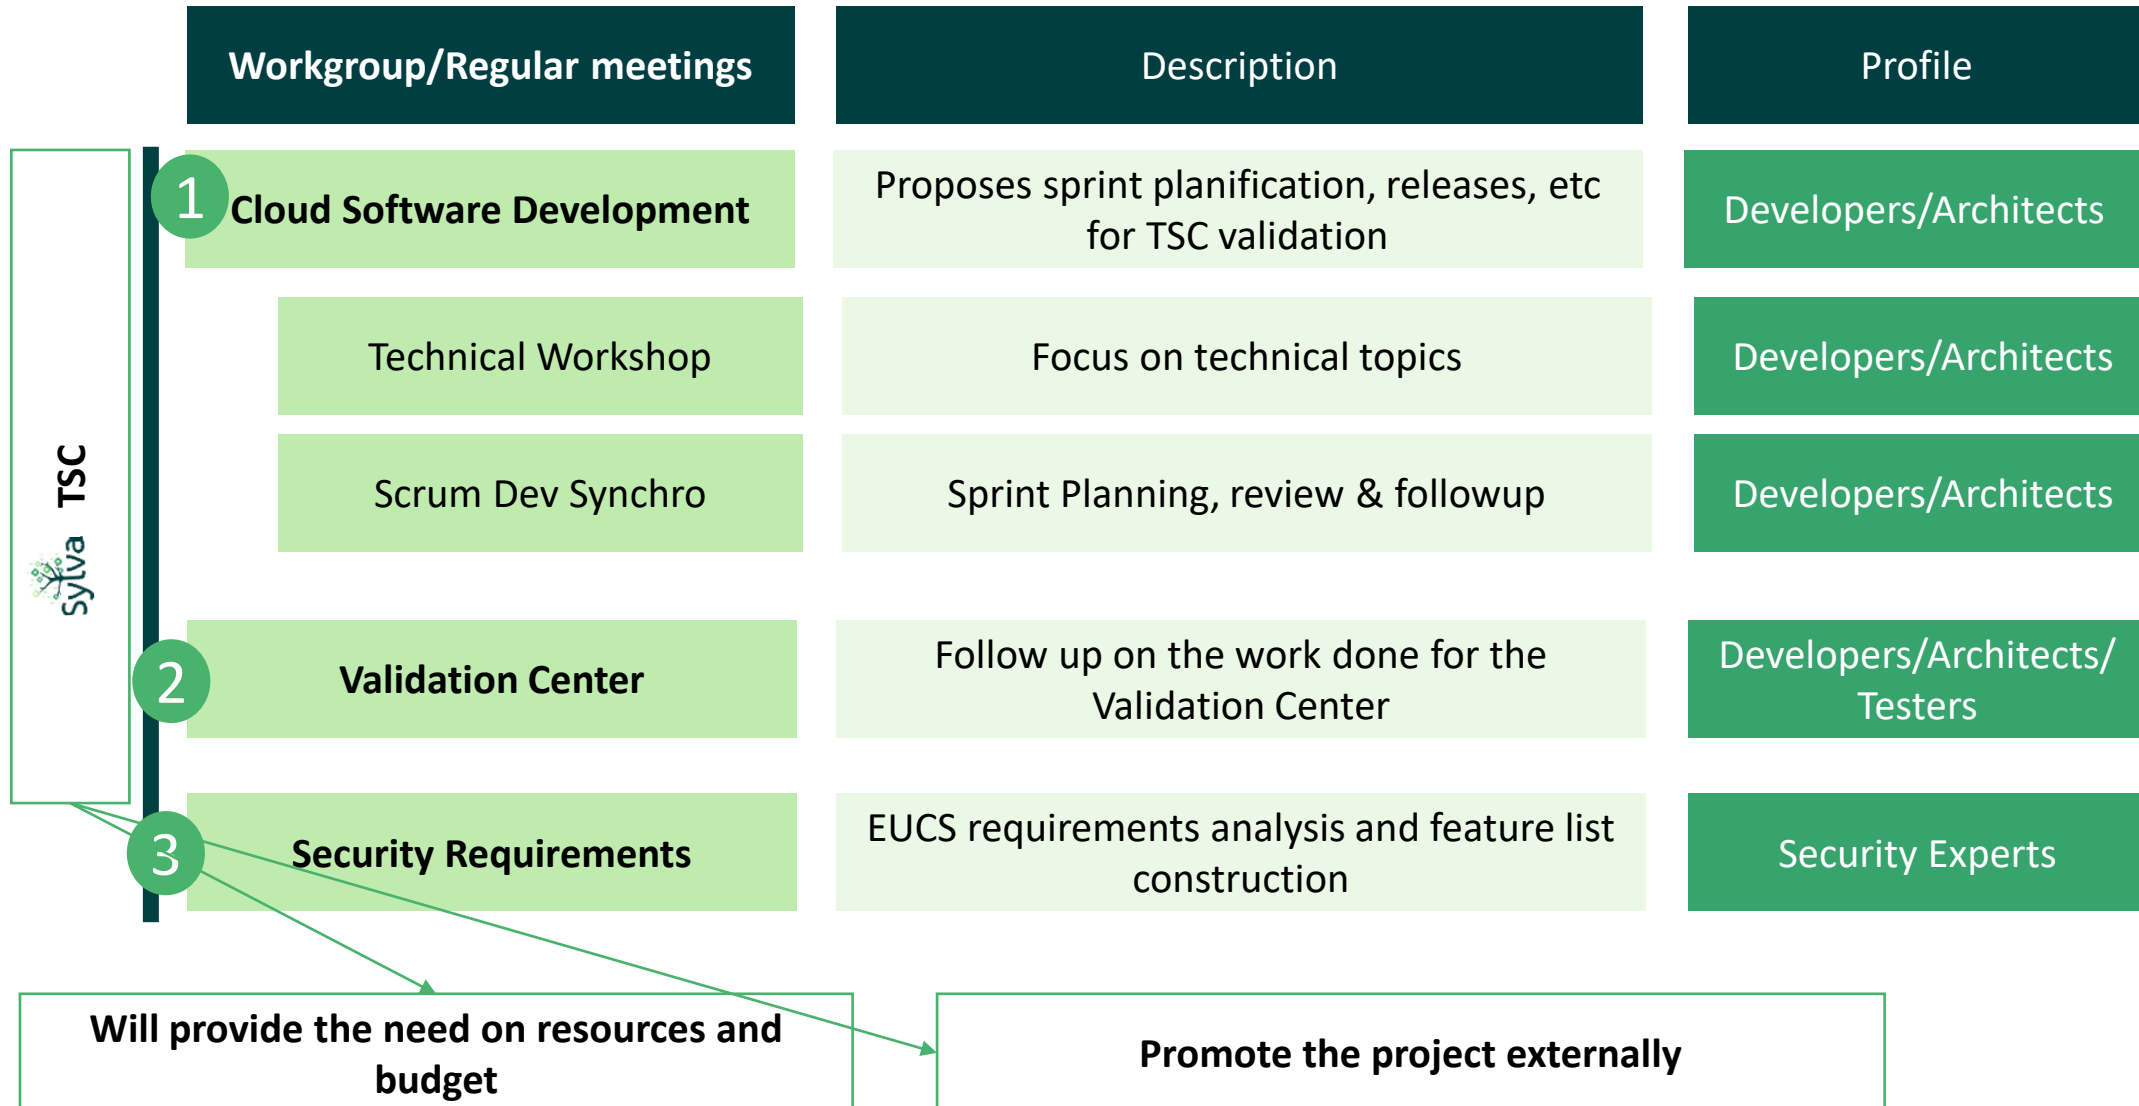

Sylva potential adoption

Today

Tomorrow

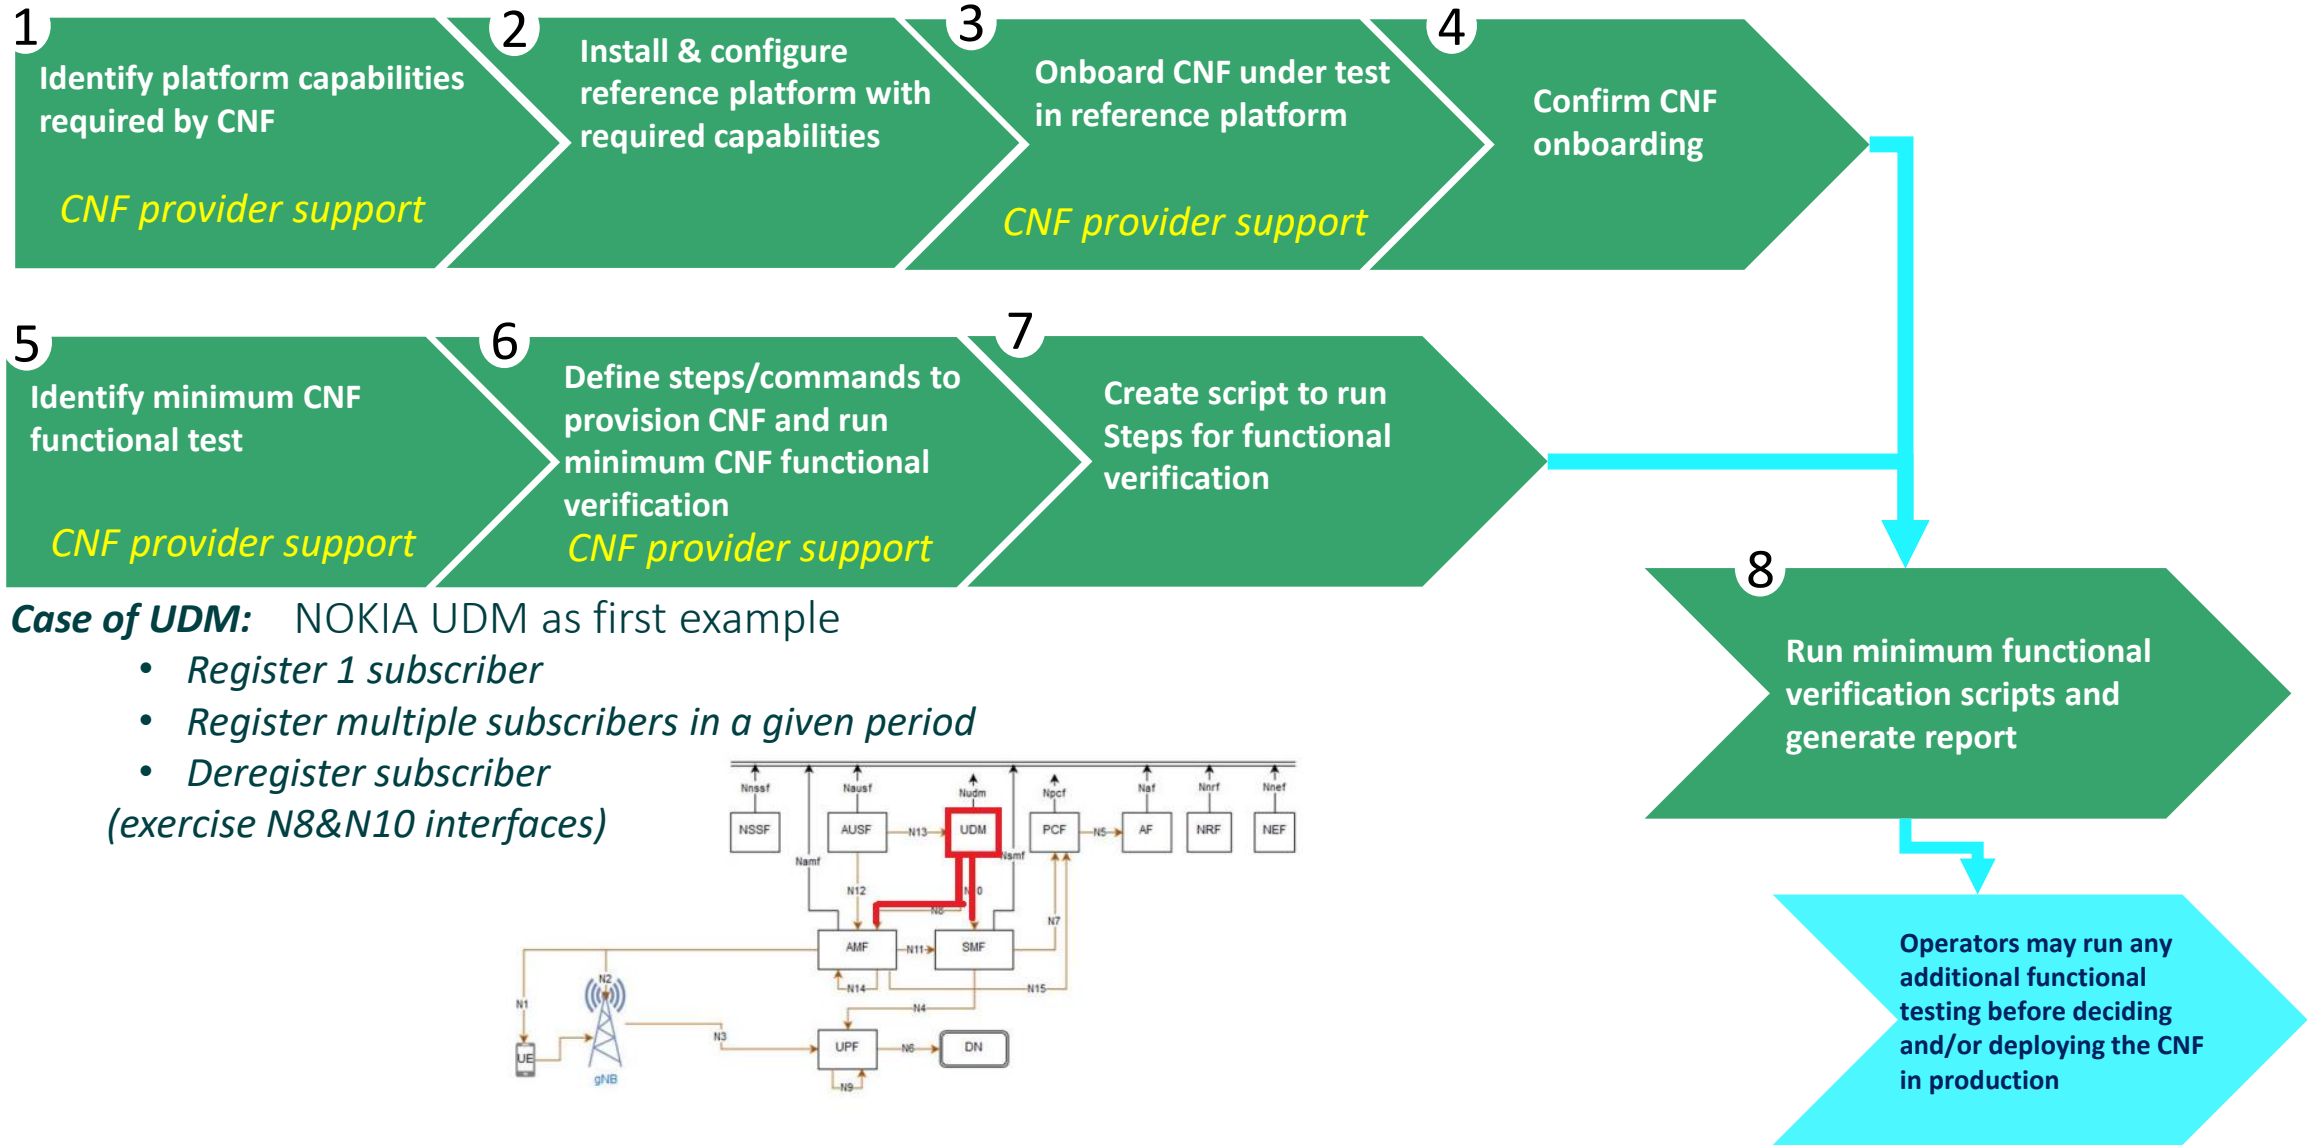

Summary of workgroups under Sylva TSC

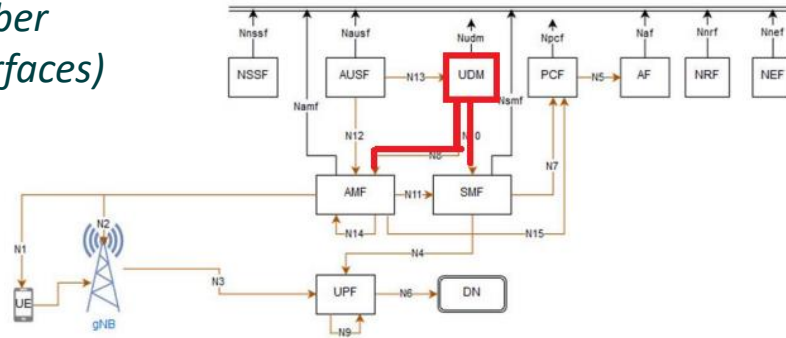

Validation Center

CNF validation process

Case of UDM: NOKIA UDM as first example

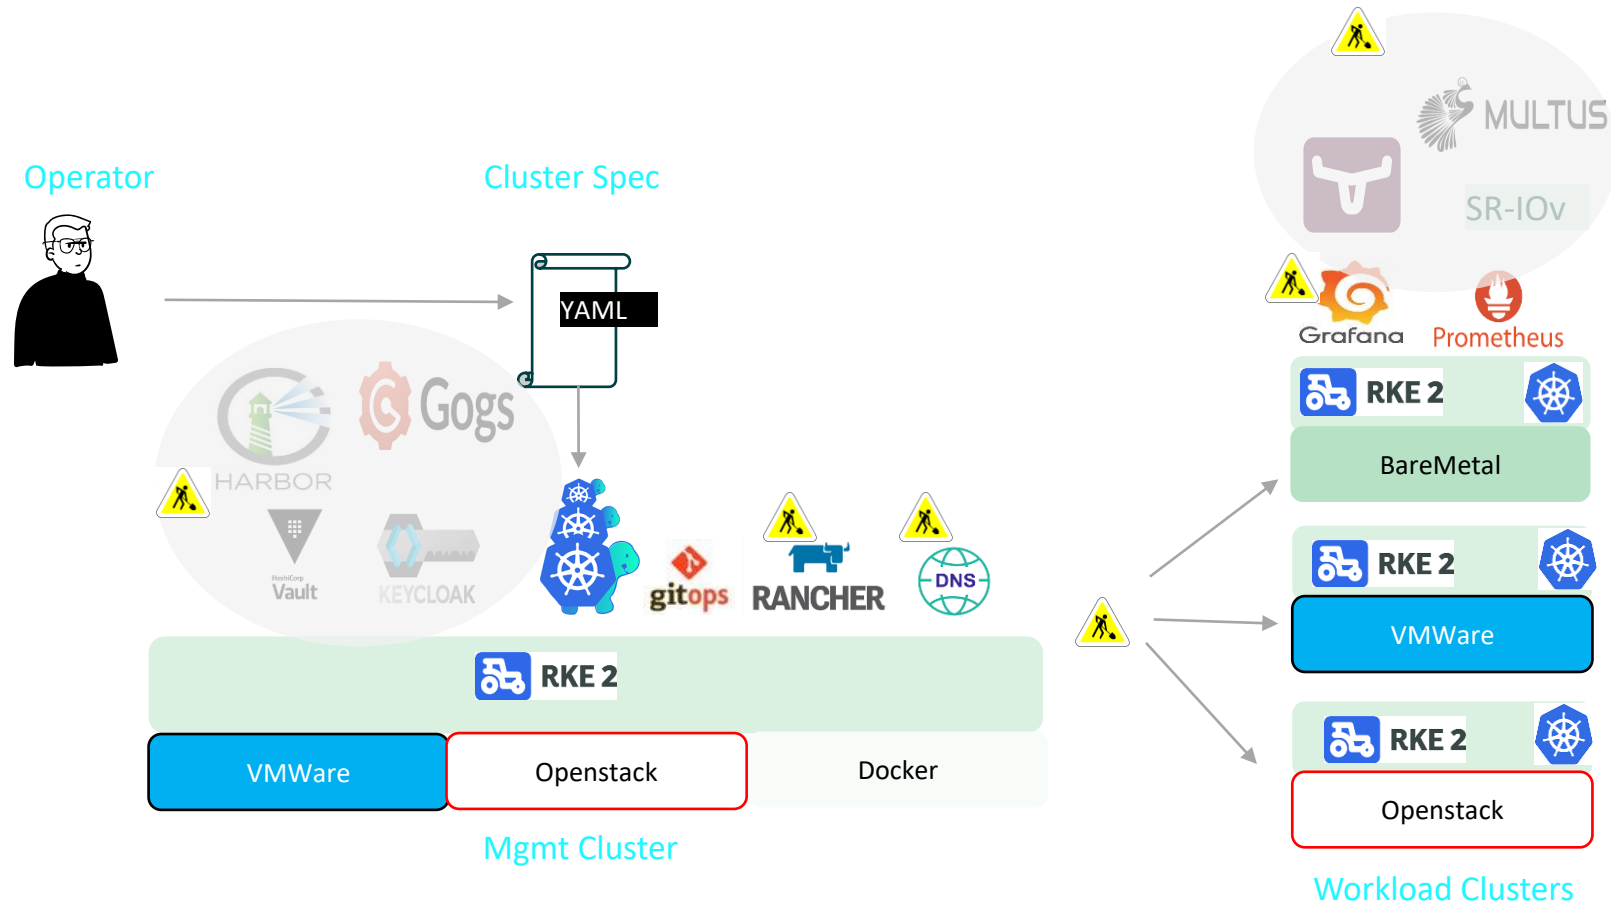

- Register 1 subscriber
- Register multiple subscribers in a given period
- Deregister subscriber
(exercise N8&N10 interfaces)

Thank You !

HLD

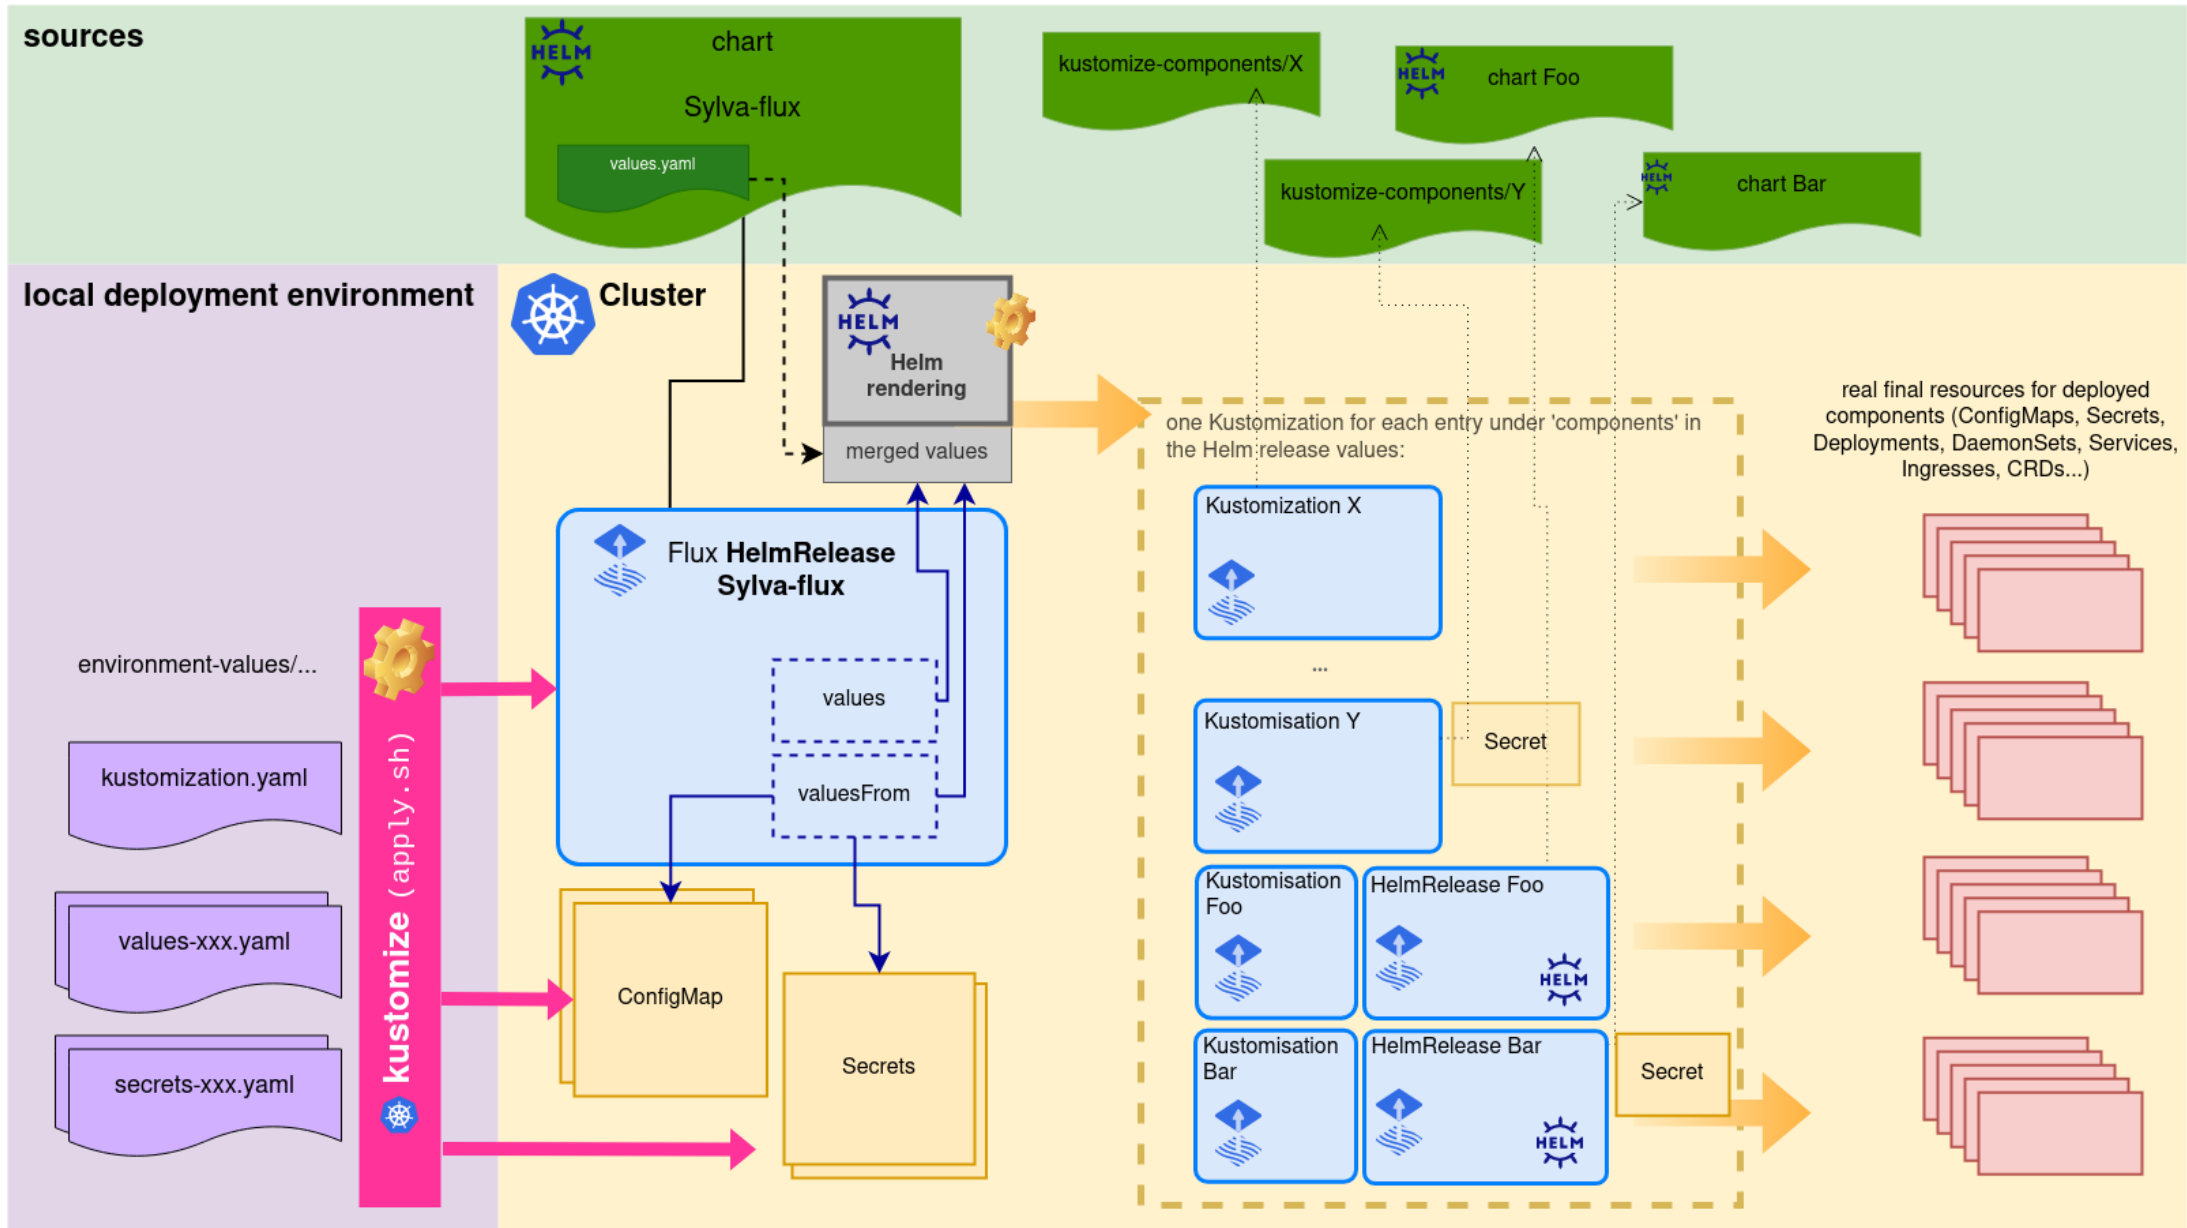

Gitops Tool: **Flux**, **Fleet** under study

K8s cluster manager: **CAPI**

Rancher started to work on a rke2 CAPI bootstrap provider:
